Title : Advanced Administration for
Citrix XenApp 5.0 for
Windows for Windows
Server 2008

Version : Demo

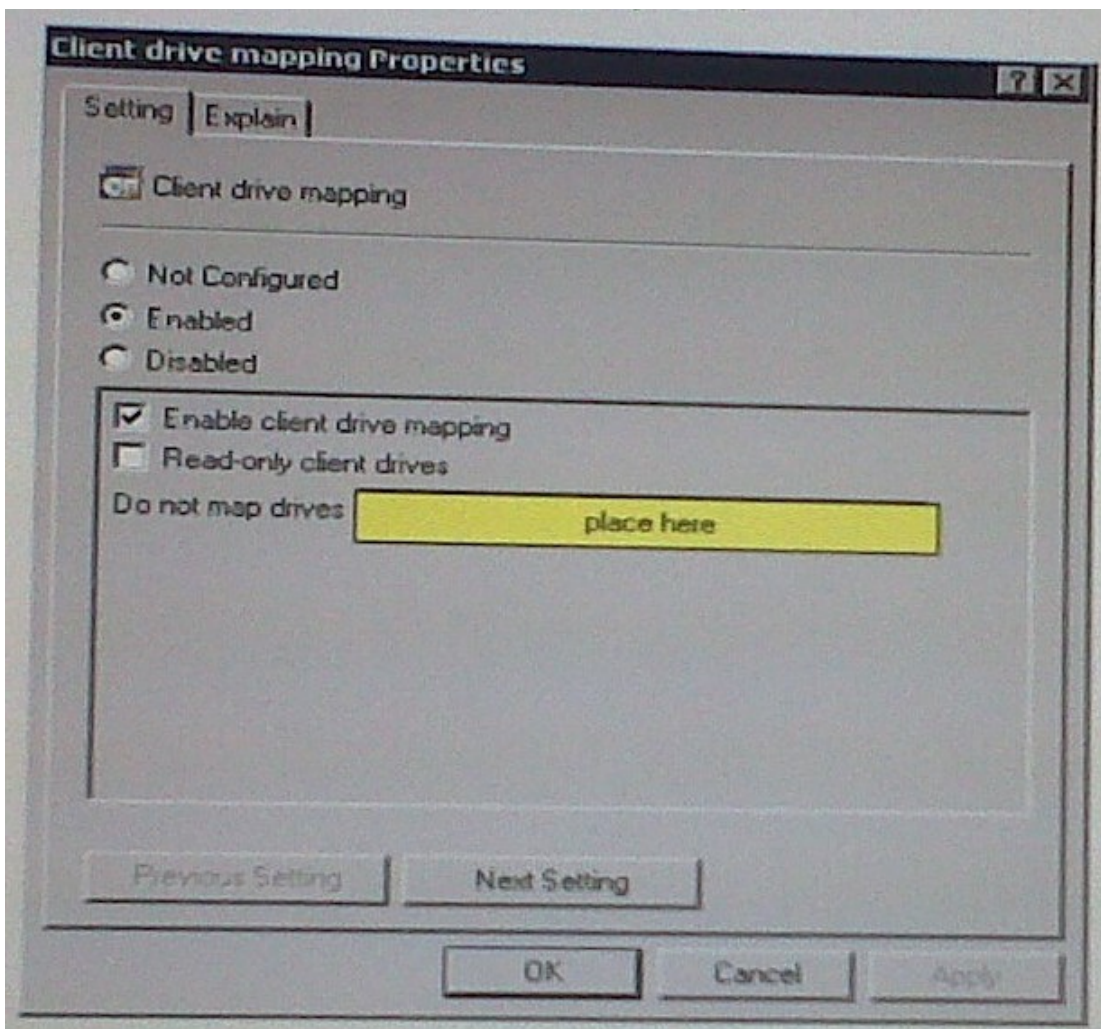

1.Scenario: An administrator creates a new load evaluator in a Citrix XenApp farm. During routine investigations the administrator discovers that one Citrix XenApp server is hosting nearly 50% more sessions than any other Citrix XenApp server in the farm.

Which object can the administrator view to identify which load evaluators have been applied to each server?

- A. Log tab in the XenApp Advanced Configuration tool
- B. Farm Properties in the Access Management Console
- C. Server Properties in the Access Management Console
- D. Contents tab in the XenApp Advanced Configuration tool
- E. Usage reports tab in the XenApp Advanced Configuration tool

Answer: E

2.An administrator needs to allow client drive mapping using the ICAClient.ADM template. Drives A through D should NOT be mapped Correct configuration into the dialogue box to disallow the mapping of drives A through D.?

- A. A-D
- B. A:D
- C. ABCD
- D. A to D

Answer: C

3.Which Citrix service directly depends on the IMA service?

- A. WMI
- B. Licensing
- C. XTE Server
- D. Print Manager

Answer: A

4.Which two commands can an administrator use to check for disconnected ICA sessions? (Choose two)

- A. QWINSTA
- B. QFARM /APP
- C. QFARM /DISC
- D. QFARM /LOAD
- E. QUERY LOGON

Answer: AC

5.Scenario: Users are reporting that their printers are NOT auto-creating. The administrator investigates and discovers that the Citrix Print Manager Service is NOT running. When attempting to start the service, the administrator receives the error shown in the attached screenshot.

Click the Exhibit button to view the error message.

Which two actions could resolve this issue? (Choose two.)

- A. Recreate the Ctx_cpsvcuser account
- B. Recreate the network Service account
- C. Recreate the Ctx_streamingsvc account
- D. Ensure the Ctx_cpsvcuser account has logon as service rights
- E. Ensure the Network Service account has logon as service rights
- F. Ensure the Ctx_streamingsvc account has logon as service rights

Answer: AD

6.Scenario: A company has just recovered from a major power failure. The administrator at the company currently leverages a single Citrix XenApp server farm with two sites for application delivery. The administrator set up a zone preference and failover policy which successfully directed users to the secondary site during the power failure.

How can the administrator switch the users back to the primary site now that it is recovered?

- A. Reassign the policy filters to a different user group
- B. Instruct users to log off their sessions and log on again
- C. Configure a custom load evaluator by client IP address and assign it to the primary site servers
- D. Edit the existing zone preference and failover policy and make the secondary site the Primary site
- E. Configure a new zone preference and failover policy and assign the secondary site as Backup site 1

Answer: B

7. In which situation should the “CPU Utilization Management/CPU Rebalancer” service be set to start automatically?

- A. Citrix XenApp runs on a single processor server
- B. The Resource Manager tool is used to monitor CPU sharing
- C. It is desirable to monitor CPU sharing using the Access Management Console
- D. Multiple instances of a single-threaded application are running on the same CPU

Answer: D

8. Scenario: A Citrix XenApp farm consists of one data center that hosts several dozen Citrix XenApp servers. An administrator in the farm is creating a disaster recovery plan and has secured data center space in Timbuktu. After provisioning a dozen servers to that location, the administrator begins configuring zone preference and failover so that, if necessary, all users can access applications from the disaster site.

Once properly configured, users can leverage the latest _____ when accessing the farm through a _____. (Choose the three correct options to complete the sentence.)

- A. Client for Java; XenApp Web site
- B. Client for Linux; XenApp Web site
- C. Plugin for Hosted Apps; XenApp Services site
- D. Windows CE-based client; custom ICA connection
- E. XenApp Plugin for Hosted Apps; Program neighbourhood interface

Answer: ACE

9. What should an administrator do to troubleshoot an issue involving a single user who is unable to save files to his or her local desktop when other users can save files to their local desktops?

- A. Check the properties of the Citrix XenApp farm
- B. Check the permissions on the local client drive
- C. Check the properties of the published application
- D. Check the permissions on the Citrix XenApp server drive

Answer: B

10. Scenario: An administrator has been assigned the task of creating and testing application streaming profiles. The initial phase of the project will only involve streaming applications to the Citrix XenApp servers.

According to Citrix best practice, the profiler system should be installed on a _____ and include _____. (Choose the correct pair of options to complete the sentence)

- A. Windows XP; a XenApp plugin for testing streamed applications

- B. Windows Vista workstation; a XenApp plugin for testing streamed applications
- C. Windows server; Standard programs that are part of the company image, such as an antivirus program
- D. Windows Vista workstation; Standard programs that are part of the company image, such as an antivirus program

Answer: C

11. An administrator must configure streamed applications to work for some Windows-based laptop users who may NOT be connected to the corporate network when working remotely.

Which two steps must the administrator perform in order to meet the needs of this environment?

(Choose two.)

- A. Configure laptop users for offline access
- B. Install the XenApp Web Plugin on each laptop
- C. Configure the application profiles for offline access
- D. Enable the published application for offline access

Answer: AD

12. Scenario: During testing, a new application crashes on Citrix XenApp servers. After investigating, the administrator identifies that the application is NOT compatible with the virtual memory management feature, which has been enabled.

How can the administrator prevent the application from being affected by the memory management feature without disabling memory management for all applications?

- A. Add the application to the .SFO file
- B. Stream the application to the server
- C. Add the application to the Exclude Application list
- D. Remove the application from the memory management list in the registry

Answer: C

13. Scenario: A Citrix XenApp server in a farm is heavily loaded; logon time has increased significantly. The CPU resources are dominated by a particular application. A single user running that application is affecting all the other users connected to the Citrix XenApp server.

How would the administrator resolve this issue?

- A. Assign the Advanced Load Evaluator to all servers
- B. Enable 'Fair sharing of CPU between sessions' on the entire farm
- C. Create a new load evaluator to load manage the application by CPU utilization
- D. Configure a special Health Monitoring and Recovery item to show when the CPU utilization is high

Answer: B

14. Which two reasons would cause an administrator to exclude certain applications from Memory Optimization before testing them? (Choose two.)

- A. Some application components are digitally signed
- B. The applications allow Windows to load the .DLL files it calls
- C. The applications are memory-intensive when run in multiple sessions
- D. The applications use Windows Rights Management to protect its .DLL files
- E. The applications download additional components from the Internet during installation

Answer: AD

15.Scenario: Citrix administrators in a remote office are experiencing slow performance when using the Access Management Console.The environment uses a Microsoft SQL 2005 data store, and there are 300 Citrix XenApp servers in the farm.

What could be the cause of the slow performance?

- A. The IMA service is NOT started
- B. Too many servers are in the farm
- C. Zone preference and failover is NOT configured
- D. Latency between the remote location and the data store server

Answer: B

16.With the least administrative effort, what could an administrator do to verify that the Citrix XenApp servers in an environment have the same hotfix revision?

- A. Run the CPATCH /L command and compare the hotfixes
- B. Create a hotfix list and compare the servers using the Access Management Console
- C. Use the Program and Features option in the Windows Control Panel and compare the hotfixes
- D. Create a new hotfix list and compare the servers to the hotfix list in the XenApp Advanced Configuration tool

Answer: B

17.Scenario: Since a recent server consolidation project which reduced the number of servers in the farm, users cannot access published applications on the Web Interface site.The Citrix administrators can access the Citrix XenApp servers through remote desktop connections but cannot discover the farm from the Access Management Console.

What could be preventing the Access Management Console from discovering the farm?

- A. Citrix XenApp servers were NOT rebooted
- B. The SQL database for the XenApp data store was moved
- C. The users do NOT have the latest XenApp Plugin installed
- D. Servers that were hosting applications were removed from the farm

Answer: A

18.Scenario: An administrator configured Citrix XenApp in an environment and used a SQL Server data store. The SQL server data store database has been moved to another SQL server.

Which two steps must be performed on the Citrix XenApp servers to complete the relocation of the data store? (Choose two.)

- A. Run the CHFARM command
- B. Create a new DSN file that points to the relocated database
- C. Run the DSMMAINT CONFIG command to change the IMA service configuration on all servers in the farm
- D. Run the DSMMAINT MIGRATE command to change the IMA service configuration on all servers in the farm

Answer: BC

19.Scenario: The Citrix IMA service fails to start and the “IMA_RESULTS_ACCESS_DENIED” error message is presented. A SQL data store database is used in the environment. After several troubleshooting steps, the administrator decides to run the CHFARM command.

Which two options are available when running the CHFARM command to resolve the IMA service error? (Choose two.)

- A. Create a new farm
- B. Join an existing farm
- C. Reconfigure the existing farm
- D. Recreate the Local Host Cache

Answer: AB

20.Scenario: Sessions are NOT being directed to a new Citrix XenApp server in a farm. The administrator investigates further and notices that this server is reporting a load of 20000.

This indicates that the server _____. (Choose the correct phrase to complete the sentence.)

- A. is NOT licensed properly
- B. processor is running at 100%
- C. does NOT have a load evaluator assigned
- D. has failed a Health Monitoring and Recovery test

Answer: A
